

Checklist

Prepare and adapt

- ☐ Write two short advisory tasks that reflect real work in your domain, one routine and one more complex, and involve domain experts so the scenarios are realistic.
- ☐ Insert your specific domain in the final item of the demographics form.
- ☐ Adapt the study introduction with your organization and domain.
- ☐ Insert your chatbot's name, the relevant role, and domain references into the interview questions and prior-experience questions.
- ☐ Download the CUQ calculation tool from the authors' website.
- ☐ Set up the survey on an online platform with the three instruments in order: RTLX, CUQ, and Perceived Trustworthiness.
- ☐ Arrange recording for each session, via video conference or in person.

Run each session

- ☐ Collect the demographics form before the session begins.
- ☐ Give the introduction to the study and its procedure.
- ☐ Let the participant read both tasks.
- ☐ Record one task-solving confidence rating per task, before the interaction.
- ☐ Let the participant work through both tasks with the chatbot, without guidance.
- ☐ Record one helpfulness rating per task, immediately after the interaction.
- ☐ Administer the survey (RTLX, CUQ, Perceived Trustworthiness).
- ☐ Conduct the semi-structured interview, including the XAI Novice Question Bank selection and questions about prior experience and chatbot use.

Analyze the data

- ☐ Read RTLX at the subscale level and compare against reference values.
- ☐ Score the CUQ from 0 to 100 with the calculation tool, and treat results comparatively.
- ☐ Analyze Perceived Trustworthiness subscale by subscale, combining it with qualitative data where useful.
- ☐ Code the interviews with thematic coding analysis in a tool such as ATLAS.ti, inductively for emerging themes and deductively for information needs.
- ☐ Analyze information about the participants' prior experience and chatbot use.
